### **Numerical models and experimental simulation of**

Specifically the model is used to predict the observed crack pattern, initiation stress and direction and coalescence stress and type. In fracture mechanics, two numerical methods are most frequently employed: The Finite Element Method (FEM), and the Displacement Discontinuity Method (DDM). In the FEM, the

models with regularized fracture and define their evolution in time. Section 3 is dedicated to showing that they satisfy a Clausius-Duhem type inequality. In Section 4, we introduce a semi-discrete time evolution, which is the base, in the final section, for numerical experiments in the case of 1D, 2D traction 2
